

# Nine Years, Eight Thousand Kilometres

A self-tracked record of running, walking, riding, and hiking — and the static site that keeps it honest.

Tao

Through 2026-08-24

8,252 km total distance 1,539 hours moving 3,820 activities logged 1,713 active days since 2017

Since March 2017 I have logged every run, walk, ride, and hike I could measure. The result is a continuous paper trail of 8,252 km and 1,539 hours of movement — not a training plan, but a habit of paying attention.

## The Movement

Walking carries the volume; running carries the ambition. Two platforms feed the record — COROS for GPS-accurate sport sessions and Keep for indoor training and habit check-ins.

- Running: 509 sessions, 3,487 km, longest single run 29.1 km
- Walking: 2,940 sessions, 4,015 km — the quiet backbone of the data
- Riding & hiking: 24 rides (64.8 km longest), 20 hikes, plus 11 moto tracks

## The Project

My Workouts is a self-hosted static site that turns raw activity files into a journal. Python sync scripts merge COROS .fit exports and Keep data into one data layer; the page renders it with no backend.

- Annual heatmap, GPS track maps (Leaflet), and habit check-ins — all client-side
- 303 habit check-ins logged: plank 94, situps 137, push-ups 69
- Vanilla JS + HTML/CSS on GitHub Pages; inspired by zhaohongxuan/workouts

## The Arc three-step journey

### 2017

#### First track

One COROS account and a habit of pressing start before every outing.

### 2021

#### Two sources

Keep sync added, so indoor training and habit reps joined the GPS record.

### 2025

#### The dashboard

Auto-sync scripts and a static site turned nine years of files into one page.

Consistency, not intensity, is the finding: 1,713 active days across nearly a decade — roughly one in two days, every year, without a resolution or a coach. Next: automate the COROS sync to a nightly cron so the page never falls a day behind.
